11/4/70

Dick,

Paul sent me a series of xeroxes of pix numbered A5 through A24. They show a bullseye target attached to the front of a structure that may be no more than burlap, affixed to a frame that is baout 4 inches from front to back. Assuming there is nothing more than paper and burlap, can this influence a soft soft bullet of that velocity? If the frame is no more than 4", then the melon can be no more than 6" It is also shown resting in something like a saucer. In A 6 is is <u>back</u> from its pictured and marked resting place, in 8 back and to the side. They also seem to have used an empty ~~glxxxxxx~~ glass bottle, a plastic one like from Chlorox.

The more Paul writes the more I worry about <u>him</u>.
